

CMS in general, Daisy in particular:7

1

Daisy Wiki - 1

- Cocoon uses **pipelines** to transform XML documents via XSLT
- Overall control via the **sitemap** (xml configuration file)
- Define the chain of **components** that comprise a pipeline
- Matching document elements determines which pipeline is used
- Final result is typically an HTML page, but can also be PDF, etc
- Customization can include ...
 - Skinning by altering the **default CSS** or **XSLT layout**
 - Changing or adding new components to the pipelines
